PUNK SOFTWARE HACK NIGHT #9

PUBLIC GOSSIP

Posts that travel by people, not servers.

An Android app built tonight

HOW IT WORKS

1

BE NEAR SOMEONE

Two phones find each other over Bluetooth and Wi-Fi.

2

POSTS JUMP ACROSS

Each post is signed with your own key. No internet, no server, no account.

3

THEY CARRY IT ON

The next person they meet gets it too, marked with how many hops it took.

WHY IT'S PUNK

NO COMPANY HOLDS YOUR POSTS	They live on your phone and on the phones of people you met. Nobody can sell, rank or delete them.
REACH HAS A CEILING	A post only goes as far as people physically carry it. Nothing goes viral, so there is no network effect to capture.
DELIVERY IS SLOW ON PURPOSE	Posts arrive when you meet. There is no feed to refresh.

IT ONLY NEEDS ONE OTHER PERSON

NOTES FOR MY LOVER. DELIVERED WHILE WE'RE TOGETHER. READ AFTER THEY'VE GONE HOME.

Two people and two phones is the whole network.

WHERE IT GOES

An AI you customize, running for you, decides what to pass on and who to connect.

YOU SET THE TERMS

Your sharing preferences and your personal asks, in your own words.

YOUR AI FORWARDS

It passes on posts and connections based on your friends and networks.

FRIENDS CONNECT FRIENDS

Each person tunes their own AI, so what spreads is chosen by people you know.

BUILT TONIGHT, COMING NEXT

TONIGHT

- Nearby Android phones find each other
- Signed public posts sync with no internet
- [Posts forwarded onward with a hop count]

NEXT

- Friends only, and friends of friends
- Automatic sync with people you know
- Your own AI choosing what to forward

Have an Android phone? Come find me and trade a post.
